

## RESULTS ON CARDINAL AND ORDINAL NUMBERS

K.V.R. Srinivas<sup>1\*</sup><sup>1\*</sup> professor , Giet Engineering college,Rajahmundry**\*Corresponding Author:** K.V.R. Srinivas  
\* professor , Giet Engineering college, Rajahmundry**Abstract:-** In this paper mainly we have obtained certain results on cardinal and ordinal numbers.**Introduction:-** Cardinal numbers are basically those numbers which provide us an exact quantity of an object. In general on the set of real numbers, the relation ' $\leq$ ' is compatible relation. In this paper mainly we obtained certain results on Cardinal and ordinal numbers. It is observed in result '1' that on the relation ' $\leq$ ' is also compatible on cardinal numbers. It is known that if  $a \leq b$  then  $a+c \leq b+d$  and  $a.c \leq b.d$  it is also true on the set of cardinal numbers which is obtained in result 2; In general we have the elementary result on the set of real numbers that  $a^{(b+c)} = a^b . a^c$ ;  $(ab)^c = a^c . b^c$ ,  $a^{bc} = (a^b)^c$ . It is observed that the results holds for the set of cardinal numbers in Result 4. In result '5' We obtained that if  $a, b, c$  are cardinal numbers in which  $a \leq b$  then  $a^c \leq b^c$ ; In general it is true for the set of real numbers that if ' $a$ ' is finite and ' $b$ ' is infinite then  $a+b$  is infinite which is also true for the set of cardinal numbers which is obtained in result 6. In general it is observed that if ' $a$ ' is infinite then  $a+a$  is infinite. If ' $a$ ' is an infinite cardinal number then  $a+a = a$  which is obtained in result 7. We also obtained necessary and sufficient condition on the set of ordinal numbers which is obtained in result 8.

First we start with the following definition;

**Def 1:** If  $a$  and  $b$  are cardinal numbers and if  $A$  and  $B$  are disjoint sets with  $\text{card } A = a$  and  $\text{card } B = b$  then the sum of the cardinal numbers  $a$  and  $b$  is  $a+b = \text{card}(A \cup B)$ **Def 2:** If  $\{a_i\}$  is a family of cardinal numbers and if  $\{A_i\}$  is the corresponding indexed family of pairwise disjoint sets with  $\text{card } A_i = a_i$  for each  $i$ , then  $\sum a_i = \text{card}(\cup A_i)$ .

we have the following result.

**Result 1:** If  $a, b, c$  and  $D$  are cardinal numbers such that  $a < b$  and  $c < d$  then  $a + b < c + d$ .**proof:** we have  $\text{card } A = a$ ,  $\text{card } B = b$ ,  $\text{card } C = c$  and  $\text{card } D = d \rightarrow \text{card } A < \text{card } B \Rightarrow A \sim B$ .since  $C < d \Rightarrow \text{card } C < \text{card } D \Rightarrow C \sim D$  $\Rightarrow A \cup C \sim B \cup D$  $\Rightarrow \text{card}(A \cup C) < \text{card}(B \cup D)$  $\Rightarrow a + c < b + d$ **Def 3:** if ' $a$ ' and ' $b$ ' are any two cardinal numbers of the disjoint sets  $A$  and  $B$  with  $\text{card } A = a$  and  $\text{card } B = b$  then the product of the two cardinal numbers  $a$  and  $b$  is $A . b = \text{card}(A \times B)$ If  $\{a_i\}$  is the set of cardinal numbers of the disjoint sets  $\{A_i\}$  with  $\text{card } A_i = a_i$ . Then  $\prod a_i = \text{card}(\prod A_i)$ **RESULT 2:** if  $a, b, c$  and  $d$  are cardinal numbers with  $a \leq b$  and  $c \leq d$  then  $a.c \leq b.d$ **PROOF:** since  $a \leq b \Rightarrow \text{card } A \leq \text{card } B \Rightarrow A \sim B$ Since  $c \leq d \Rightarrow \text{card } C \leq \text{card } D \Rightarrow C \sim D$  $\Rightarrow A \times C \sim B \times D$  imply that  $a.c \leq b.d$ .**RESULT3:** if  $\{a_i\}_{i \in I}$  and  $\{b_i\}_{i \in I}$  are family of cardinal numbers such that  $a_i < b_i \forall i \in I$ Then  $\sum a_i < \sum b_i$ **Proof:-** let  $\{A_i\}_{i \in I}$  be indexed of family of the set with  $\text{card } A_i = a_i$  and  $\{B_i\}_{i \in I}$  be indexed of family of

the set with card  $B_i = b_i$

Let  $a_i < b_i \Rightarrow \text{card} A_i < \text{card} B_i$

$\Rightarrow A_i \sim B_i \Rightarrow U_i A_i \sim U_i B_i$

$\Rightarrow \text{card}(U_i A_i) < \text{card}(U_i B_i)$  imply that  $E_i a_i < \pi_i b_i$

**Def 4:-** if  $a$  and  $b$  are any two cardinal numbers of the disjoint sets  $A$  and  $B$  with  $\text{card} A = a$  and  $\text{card} B = b$  then  $a^b = \text{card}(A^B)$

**Result 4 :-** if  $a, b$  and  $c$  are cardinal numbers then

i.  $a^{b+c} = a^b \cdot a^c$

ii.  $(ab)^c = a^c \cdot b^c$

iii.  $A^{bc} = (A^b)^c$

**Proof:-** Since  $a, b, c$  are the cardinal number there exists disjoint sets  $A, B, C$ , with  $\text{card} A = a$ ;  $\text{card} B = b$  and  $\text{card} C = c$

Now,  $1. a^{b+c} = \text{card}(A^{B+C})$

$= \text{card}(A^B A^C)$

$= \text{card} A^B \cdot \text{card} A^C$

$= a^b \cdot a^c$

2.  $\text{card}(A^{B+C}) = \prod_{i \in I} a_i$  where 'I' is the indexed set which has cardinality  $b+c$ .

$\prod_{i \in I' + I''} a_i = \prod_{i \in I'} a_i \cdot \prod_{i \in I''} a_i$

where  $I'$  is the indexed set which has cardinality 'b' and  $I''$  is the indexed set which has cardinality 'C'

$= a^b \cdot a^c$  hence  $a^{b+c} = a^b \cdot a^c$

3.  $(ab)^c = \text{card}(AB)^c = \prod_{i \in I} a_i \cdot b_i$  where 'I' is the indexed set which has cardinality 'c'  $= \prod_{i \in I} a_i \cdot \prod_{i \in I} b_i$  where I is the indexed set which has cardinality  $a^c \cdot b^c$

Hence  $(ab)^c = a^c \cdot b^c$

4.  $a^{bc} = \text{card}(A^{BC}) = \prod_{i \in I} a_i$

where I is the indexed set which has cardinality  $BC = \prod_{i \in I} a_i^{b_i \cdot c_i}$

$=$  the indexed set which has cardinality  $a^{bc}$

$=$  the indexed set which has cardinality  $(a^b)^c$ .

Now we have the following Definition

**Def 5:-** a cardinality number is said to be finite if it is the cardinal number of a finite set and is said to be infinite if it is the cardinal number of an infinite set.

**Result 5:-** If  $a, b, c$  are cardinal numbers such that  $a \leq b$  then  $a^c \leq b^c$

**Proof:-**

Let  $a, b, c$  be the cardinal number then there exists disjoint sets  $A, B$  and  $C$  with  $a = \text{card} A, b = \text{card} B, c = \text{card} C$

Since  $a \leq b \Rightarrow \text{card} A \leq \text{card} B$

$\Rightarrow A \sim B$

$\Rightarrow A^C \sim B^C \Rightarrow \text{card} A^C \leq \text{card} B^C$ .

**RESULT 6:-** IF  $a$ , and  $b$  are cardinal numbers such that 'a' is finite and 'b' is infinite then  $a+b=b$ .

**Proof:-**

Since  $a$  and  $b$  are cardinal numbers then there exists disjoint sets  $A$  and  $B$  such that  $\text{card} A = a$  and  $\text{card} B = b$ . Since 'a' is finite, the set 'A' is equivalent to some natural number

$\Rightarrow A \sim K$

Since 'B' is infinite  $W \sim B$

Now we have to define a map  $f: A \cup B \rightarrow B$

By,  $f/A: A \rightarrow K$

$$f/W:n \rightarrow n+k \quad \forall n \text{ q.e. } f(n)=n+k. \quad \forall n$$

$$f/B-W:x \rightarrow x \quad \forall n \in B-W$$

hence there exists a one to one correspondence between AUB to B i.e.  $AUB \sim B$

$$\Rightarrow \text{card}(AUB) = \text{card } B \quad \text{Implies } a+b=b$$

RESULT7:-if 'a' is an infinite cardinal number then  $a+a=a$ .

Proof is trivial.

Now we have the

**RESULT8:-**if  $\alpha, \beta$  are distinct ordinal numbers then  $\beta \in \alpha$ , iff  $\beta \subset \alpha$  and  $\beta$  is continuation of  $\alpha$

**Proof:-**

Let  $\alpha \in \beta$  we claim that  $r \in \alpha$

Since  $r \in \beta \Rightarrow s(r) = r$ .

$$S(\beta) = \{\delta \in \alpha : \delta < \beta\}$$

Since  $r \in \beta \Rightarrow r \in S(\beta) \Rightarrow r \in \alpha$

Hence  $\beta \subset \alpha$ .

Conversely suppose  $\beta \subset \alpha$ , Since ' $\alpha$ ' is an ordinal number,  $s(\alpha) = \alpha$

$$\Rightarrow \beta \subset s(\alpha) \Rightarrow \beta \in \alpha$$

Hence  $\beta \in \alpha$  iff  $\beta \subset \alpha$

Define  $\leq$  by  $\beta \leq \alpha$  iff  $\beta \subset \alpha$  or  $\beta \in \alpha$

Clearly  $\leq$  is a partial order relation and for  $\beta \in \alpha \Rightarrow \beta \subset \alpha$  as  $s(\beta) = \beta$

$$\text{We have } s(\beta) = \{\delta \in \alpha : \delta < \beta\} = \beta$$

$\Rightarrow$  ' $\alpha$ ' is the initial segment continuation of  $\beta$

Conversely, ' $\alpha$ ' is a continuation of  $\beta$ ,

$$B = \{\delta \in \alpha : \delta < r\} = s(r)$$

$$\Rightarrow \beta \subset \alpha \Rightarrow \beta \in \alpha$$

Hence  $\beta \leq \alpha$  iff ' $\alpha$ ' is continuation of  $\beta$ .

**RESULT 9:-**Each well ordered set is similar of a unique ordinal number.

Conclusion: We are thankful to our Hon.chairman Sri.K.V.V. Satyanarayana Raju, Vice Chairman Sri K.Sasi kiran Varma ,Executive Director Smt.K. Lakshmi Sasi kiran Varma for their extended cooperation.
